On a quiet hilltop village, a curious boy named Aarav discovered an old telescope hidden in his grandfather's attic. Every night, he aimed it at the stars, wondering if someone might be looking back. One evening, he noticed a faint flicker — a pattern that seemed to blink in rhythm, like a heartbeat in the sky. Night after night, the light returned, growing brighter until it felt almost alive. Years later, when Aarav became an astronomer, he learned the flicker came from a distant pulsar — but deep down, he still believed it was the universe whispering back to the little boy who dared to look up.
